Solid biofuel technology

Precer AB offers biofuel vehicle conversions by its new subsidiary Precer Autotech Innovation AB.

The founding of Precer Autotech Innovation is an important milestone in our strategy towards offering environmental biofuel technology to the market. The new subsidiary will focus on business within the area of light and medium vehicles, says Martin Larsson president of Precer AB in Karlstad, Sweden.

Precer Autotech Innovation offers the opportunity of converting used vehicles to different types of biofuel solutions, which includes the possibility of converting to a hybrid-, or electrical drive train.

Precer Autotech Innovations goal is to be able to offer an environmental- and economical analysis, including suggestions on a suitable biofuel conversion to customers during 2009.

With Precer Autotech Innovation started it's possible to create a line of products for conversion of light and medium vehicles that's environmentally friendly as well as reasonable in price. We find it most important to get alternatives to the fossil fuels, that up to now are dominating the market, Martin Larsson continues.

The Precer group are working with environmental adjusted biofuel solutions that fulfil the claims on future vehicles and small scale home power plants. The hybrid technology of Precer is based upon the use of solid bio fuel (such as wood pellet) as fuel in all kind of vehicles, including transport- and working vehicles as well as boats and small scale home power plants.
